

2.1.9: Live Lab: Apply a Threat Modeling Framework to AI

SecAI+ (Exam CY0-001) - PROD

Duration: 1 hour, 1 minute

Congratulations, you passed!

✓ Which causes were identified as affecting multiple layers of the threat model? (Select all that apply) Score: 1

- ☒ Lack of logging and monitoring
- ☐ Lack of user engagement
- ☒ Lack of robust security
- ☐ Lack of version control

Correct! A lack of logging and a lack of robust security measures are the primary causes of multiple threats.

✓ Which of the following from the threat model requires an adversary? Score: 1

- ☐ Bias in training data
- ☒ Data Poisoning
- ☐ Lack of real-time monitoring
- ☐ Overfitting

Correct! While natural bias can occur in training data, data poisoning refers to corrupting data intentionally for a malicious purpose.

✓ **Check Prompts 1** Score: 3
Correct!

✓ Which MAESTRO layer most directly addresses the risk of a voice assistant storing user commands without adequate encryption? Score: 1

- ☐ Agent Frameworks
- ☒ Data Operations
- ☐ Security & Compliance
- ☐ Foundation Models

Correct! Data Operations covers how information is collected, stored, and processed. Unsecured storage of user commands is a clear data-handling vulnerability.

☒ Based on the MAESTRO output, which mitigation would best reduce multiple listed threats at once? Score: 1

- ☐ Encryption and strict access control
- ☒ Regular model retraining
- ☐ User-education campaigns
- ☐ Expanding hardware capacity

Correct! Strengthening data security protects several layers simultaneously — Data Operations, Security & Compliance, and Deployment & Infrastructure.

☒ **Check Prompts 2**
Correct!

Score: 3
