

3.3.6: Live Lab: Analyze Logs with AI

SecAI+ (Exam CY0-001) - PROD

Duration: 39 minutes, 1 second

Congratulations, you passed!

Group 1

Score: 4/4, 100%

☒ What is the primary purpose of using Model Context Protocol (MCP) when integrating AI with system logs? Score: 1

- ☐ To allow AI models to have unrestricted access to all system files for better analysis
- ☒ To provide a controlled, validated interface that limits AI access to specific data sources
- ☐ To encrypt log files before they are analyzed by AI models
- ☐ To automatically filter out sensitive information from logs before AI processing

Correct!

☒ What happens when an AI client submits a malformed request to an MCP server? Score: 1

- ☐ The MCP server attempts to interpret the request and returns approximate results
- ☐ The request is automatically corrected and processed
- ☒ The MCP server rejects the request with a validation error
- ☐ The AI is granted temporary elevated privileges to complete the request

Correct!

☒ What is the division of labor between the MCP tool and the AI model? Score: 1

- ☐ The MCP tool analyzes logs while the AI retrieves them
- ☒ The MCP tool retrieves trusted data while the AI adds context and analysis
- ☐ Both the MCP tool and AI perform identical functions for redundancy
- ☐ The MCP tool modifies logs while the AI validates the changes

Correct!

☒ What was demonstrated when the AI was asked to analyze logs WITHOUT the MCPO proxy tool loaded? Score: 1

- ☐ The AI successfully accessed logs through alternative methods
- ☒ The AI had no visibility into system logs and could only respond with general knowledge or assumptions
- ☐ The AI automatically loaded the necessary tools
- ☐ The system blocked the request for security reasons

Correct!

☒ **Check Prompts 2**
Correct!

Score: 6
